

Chai Khata Component Guide

Chai Khata - Component Guide

This document explains every part of your tea shop system: what it does, what fields it has, how the numbers are calculated, and how the five components talk to each other.

How the components connect

GODAAM (Warehouse)		DUKAAN (Sale)
-----		-----
You register a Dealer and log Purchases (bags, weight, price)	->	Dealer dropdown in purchase form is fed by registered dealers
Every Purchase entry adds kg to stock	->	STOCK LEDGER adds up all purchases minus all sales, tea by tea
STOCK LEDGER	->	DUKAAN checks this before allowing a sale (can't sell more than you have)
DUKAAN sale (optionally linked to a Customer)	->	If sold to a registered Customer, updates that customer's total/due
DASHBOARD	<-	Pulls live numbers from all four components above

Nothing is entered twice. You register a dealer once, buy from them many times. You register a customer once, sell to them many times. Stock and dues are always calculated from the underlying entries - never typed in by hand - so the numbers can't drift out of sync.

1. Dashboard

Purpose: A one-glance summary of the whole shop, refreshed instantly from the other four components. You don't enter anything here.

Card	What it shows	How it's calculated
Today's Sale	Total rupees sold today	Sum of <code>total</code> for all sales dated today
This Month Sale	Total rupees sold this calendar month	Sum of <code>total</code> for sales in the current month
This Year Sale	Total rupees sold this calendar year	Sum of <code>total</code> for sales in the current year
This Month Profit	Profit earned this month	Sum of <code>profit</code> for sales in the current month
Stock Value	What your current tea stock is worth at cost	For each tea: <code>(current stock kg) x (average purchase cost/kg)</code> , summed
Pending Customer Dues	Money customers still owe you	Sum of every customer's pending

		balance
Pending Dealer Dues	Money you still owe dealers	Sum of every dealer's due balance
Low Stock Alerts	Count of teas below your threshold	Compares current stock per tea to the threshold set in Stock Ledger

Below the cards: your 6 most recent sales, and a list of any teas currently running low.

2. Dukaan (Sale) - daily selling

Purpose: Record every sale, see what's in stock as you sell, and know your profit instantly.

FIELDS ON THE SALE FORM

Field	Type	Notes
Date	date	Defaults to today
Tea Name	text (autocomplete)	Suggests tea names already in your stock
Quantity Sold (kg)	number	What you're handing over
Sale Price / kg	number	What you're charging
Customer	dropdown	"Walk-in" or any registered customer
Amount Received Now	number	Only shown if a customer is selected; leave blank to mark as fully paid

WHAT HAPPENS AUTOMATICALLY

- **Live stock check** - as you type the tea name and quantity, it shows how much of that tea you actually have. If you try to sell more than you have, the form blocks the sale with a warning.
- **Live profit** - $\text{profit} = (\text{sale price/kg} - \text{average purchase cost/kg}) \times \text{quantity}$. The average purchase cost comes from your Godaam entries for that tea.
- **Stock deduction** - the moment you save the sale, that quantity is subtracted from stock. You never touch the stock number directly.
- **Customer balance update** - if you picked a customer and didn't mark it fully paid, the unpaid part becomes their **pending amount**, visible in the Customers tab.

THE SALES TABLE

Filter by Today / Month / Year / All, or search by tea name or customer. Totals for quantity, sale value, and profit are shown at the bottom of whatever range you're viewing. Each row can be deleted (this restores the stock and reverses any customer balance change).

3. Godaam (Warehouse) - buying stock from dealers

This is split into two jobs: **who you buy from** (dealers) and **what you bought** (purchases).

3A. ADD DEALER

You register a dealer once before buying from them.

Field	Notes
Dealer Name	Required, must be unique
Phone Number	Optional

Address	Optional
Opening Due	Optional - if this dealer already had an unpaid balance before you started using Chai Khata, enter it here so the running total is correct from day one

3B. ADD PURCHASE FROM DEALER

This is where a delivery of tea gets logged and added to your stock.

Field	Type	Notes
Date	date	
Dealer	dropdown	Only registered dealers appear here
Tea Name	text	
Bags Ordered	number	How many bags you agreed to buy
Bags Received	number	How many actually arrived today
Bag Weight (kg/bag)	number	The standard weight, defaults to 62
Standard Total Weight	auto	$\text{Bags Received} \times \text{Bag Weight}$
Miss Weight / Shortage (kg)	number	Total kg short if some bags were underweight
Net Weight - Stock Qty	auto	$\text{Standard Total Weight} - \text{Miss Weight}$ - this is the real amount added to stock
Price per kg	number	What you're paying
Total Price	auto	$\text{Net Weight} \times \text{Price per kg}$ - you only pay for what actually arrived
Deposit Paid Now	number	What you're handing the dealer today
Due Amount (this purchase)	auto	$\text{Total Price} - \text{Deposit Paid Now}$
Remaining Balance (dealer total)	auto	This purchase's due plus everything already owed to that dealer from before
Pending Bags	auto	$\text{Bags Ordered} - \text{Bags Received}$ - bags still expected

Why Miss Weight matters: dealers agree on a standard bag weight (commonly 62 kg), but real bags sometimes come in light. Instead of guessing, you weigh the delivery, enter the total shortfall in one field, and every downstream number - stock, total price, and stock value on the dashboard - reflects the real weight, not the paper weight.

DEALER SUMMARY

One row per dealer: total purchased all-time, total deposited/paid, and current due. An **Add Payment** button lets you record a payment to a dealer that isn't tied to a specific delivery (e.g. clearing an old balance). A **Remove** button unregisters a dealer without deleting their purchase history.

PURCHASE ENTRIES TABLE

Every delivery you've logged, with standard weight, miss weight, and net quantity side by side so shortages are easy to spot. Searchable by dealer or tea name.

4. Customers

Purpose: Track who you sell to on credit, and what they still owe.

ADD CUSTOMER

Field	Notes
Customer Name	Required
Phone Number	Optional
Address	Optional
Customer ID	Auto-generated (CUST-0001 , CUST-0002 , ...) - you never type this

HOW A CUSTOMER'S NUMBERS ARE CALCULATED

Nothing about totals is typed in - it's all derived from their sale history, so it can never fall out of sync:

- **Total Amount / Total Sale** - sum of every sale linked to this customer
- **Receiving Amount** - sum of "amount received now" from linked sales, plus any extra payments logged separately
- **Pending Amount** - $\text{Total Amount} - \text{Receiving Amount}$

ACTIONS AVAILABLE PER CUSTOMER

- **Add Payment** - logs a standalone payment (e.g. they come in later and pay off part of their tab) without needing to tie it to a new sale
- **View History** - opens a full breakdown: every sale made to them and every payment received, plus their running totals
- **Delete** - removes the customer record; their past sales are kept and relabelled so your historical totals don't change

5. Stock Ledger

Purpose: A live inventory sheet - one row per tea name, always up to date.

Column	How it's calculated
Total Received	Sum of net weight from all Godaam purchases of this tea
Total Sold	Sum of quantity from all Dukaan sales of this tea
Current Stock	$\text{Total Received} - \text{Total Sold}$
Avg. Cost/kg	$\text{Total purchase cost} / \text{Total Received}$ - a running average across all deliveries
Stock Value	$\text{Current Stock} \times \text{Avg. Cost/kg}$
Status	"Low" if Current Stock is below your threshold, otherwise "OK"

You set the **low stock threshold** (in kg) at the top of this tab - it applies to every tea and drives the Dashboard's low-stock alert count.

Data & privacy

Everything you enter is saved automatically to this device as you go - there's no login and no server; it's yours alone. Nothing is shared unless you export or share the file yourself.

Quick reference: what feeds what

- **Dealers** -> picked in Godaam purchase form
- **Godaam purchases** -> build Stock Ledger, set average cost used for profit
- **Stock Ledger** -> checked live during every sale
- **Dukaan sales** -> reduce stock, optionally update a Customer's balance
- **Customers** -> shown as options in the Sale form, tracked independently for dues
- **Dashboard** -> read-only view pulling from all of the above
